

IV.2 Functorial property and Homotopy invariance

(1) Functorial property of π_n

$$f : (X, x_0) \rightarrow (Y, y_0) \Rightarrow f_* = \pi_n(f) : \pi_n(X, x_0) \rightarrow \pi_n(Y, y_0)$$

$$[\alpha] \mapsto [f \circ \alpha]$$

1. f_* is a homomorphism : $f \circ (\alpha * \beta) = (f \circ \alpha) * (f \circ \beta)$

2. $\text{id}_* = \text{id}$: clear

$$(g \circ f)_* = g_* \circ f_* : (X, x_0) \xrightarrow{f} (Y, y_0) \xrightarrow{g} (Z, z_0)$$

$$\Rightarrow \pi_n(X, x_0) \xrightarrow{f_*} \pi_n(Y, y_0) \xrightarrow{g_*} \pi_n(Z, z_0)$$

$$[\alpha] \mapsto [f \circ \alpha] \mapsto [g \circ f \circ \alpha]$$

3. $f, g : (X, x_0) \rightarrow (Y, y_0)$ and $f \underset{H}{\simeq} g(\text{rel } x_0)$

$\Rightarrow f_* = g_*$: The proof is the same as in π_1 -case, i.e.,
 $f \circ \alpha = H_0 \circ \alpha \simeq H_1 \circ \alpha = g \circ \alpha$

Change of Base point

Let $x_0, x_1 \in X$ and ρ be a path from x_0 to x_1 .

Given $\alpha : (I^n, \partial I^n) \rightarrow (X, x_0)$, define $\Phi : I^n \times I \rightarrow X$ as an extension of a map $\phi : J = I^n \times 0 \cup \partial I^n \times I \rightarrow X$ defined by $\phi|_{I^n \times 0} = \alpha$ and $\phi|_{\partial I^n \times \{t\}} = \rho(t)$.

(Note that J is a strong deformation retract of I^{n+1} and hence any map defined on J has an extension on I^{n+1} .)

Define $\phi_\rho : \pi_n(X, x_0) \rightarrow \pi_n(X, x_1)$
 $[\alpha] \mapsto [\Phi|_{I^n \times \{1\}}]$

1. independent of choice of Φ :

$$\text{Let } \begin{array}{ccc} & \square & \\ \rho \uparrow & \Phi & \uparrow \rho \\ & \square & \\ \alpha & & \alpha \end{array} \quad \begin{array}{ccc} & \square & \\ \rho \uparrow & \Psi & \uparrow \rho \\ & \square & \\ \alpha & & \alpha \end{array} \quad \text{be two extensions.}$$

Define a homotopy H between Φ and Ψ as an extension of a map : $I^n \times I \times 0 \cup \partial(I^n \times I) \times I \rightarrow X$ given by the following pictures.

Then $H|_{I^n \times I \times \{1\}}$ gives a homotopy between $\Phi|_{I^n \times 1}$ and $\Psi|_{I^n \times 1}$.
 $\therefore \Phi|_{I^n \times 1} \sim \Psi|_{I^n \times 1}$

2. ϕ_ρ is well-defined i.e., $\alpha \underset{H}{\sim} \alpha' \Rightarrow \Phi|_{I^{n \times 1}} \sim \Phi'|_{I^{n \times 1}}$

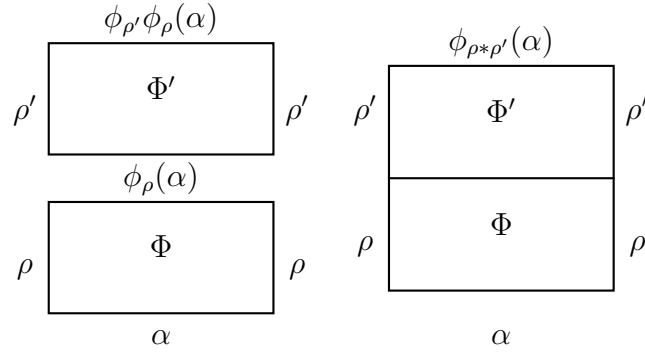

3. ϕ_ρ depends only on the homotopy class of $\rho(\text{rel } \partial)$ i.e., $\rho \underset{H}{\sim} \rho' \Rightarrow \phi_\rho = \phi_{\rho'}$, so that we can write as $\phi_{[\rho]}$.

4. $\phi_{[\rho]}$ is a homomorphism i.e., $\phi_{[\rho]}[\alpha * \beta] = \phi_{[\rho]}[\alpha]\phi_{[\rho]}[\beta]$.

5. $\phi_{\rho*\rho'} = \phi_{\rho'} \cdot \phi_{\rho}$ where $\rho(1) = \rho'(0)$:

6. ϕ_{ρ} is an isomorphism and $\phi_{\bar{\rho}} = \phi_{\rho}^{-1}$:

$\phi_{\rho} \cdot \phi_{\bar{\rho}} \stackrel{5}{=} \phi_{\bar{\rho}*\rho} \stackrel{3}{=} \phi_{x_1} = \text{id}_{\pi_n(X, x_1)}$ and similarly $\phi_{\bar{\rho}} \cdot \phi_{\rho} = \text{id}_{\pi_n(X, x_0)}$

Remark. If ρ is a loop, then $\phi_{\rho} : \pi_n(X, x_0) \rightarrow \pi_n(X, x_0)$. Hence, we have a right action of $\pi_1(X, x_0)$ on $\pi_n(X, x_0)$.

숙제 12. (1) X is n -simple.

$\stackrel{def}{\Leftrightarrow} \exists x_0 \in X$ s.t. $\pi_1(X, x_0)$ action on $\pi_n(X, x_0)$ is trivial.
 $\Leftrightarrow \forall x \in X, \pi_1(X, x)$ action on $\pi_n(X, x)$ is trivial.

(2) X is 1-simple. $\Leftrightarrow \pi_1(X)$ is abelian.

Homotopy invariance

$$1. f \stackrel{H}{\simeq} g : X \rightarrow Y \Rightarrow \begin{array}{ccc} \pi_n(X, x) & \xrightarrow{g_*} & \pi_n(Y, g(x)) \\ f_* \searrow & \curvearrowright & \nearrow \phi_\rho \cong \\ & \pi_n(Y, f(x)) & \end{array} \quad \text{where } \rho(t) = H(x, t)$$

증명

2. $f : X \rightarrow Y$ is a homotopy equivalence.
 $\Rightarrow f_* : \pi_n(X, x) \rightarrow \pi_n(Y, y)$ is an isomorphism.

증명 exactly same as π_1 -case:
